

Solution:-

```
class Parent
{
    private void method1()
    {
        System.out.println ("Parent's method1()");
    }

    public void method2()
    {    System.out.println ("Parent's method2()");
        method1();
    }
}

class Child extends Parent {
    public void method1()
    {    System.out.println ("Child's method1()");
    }

    public static void main(String args[])
    { Parent p = new Child();

        p.method2();
    }
}
```

Expected Output:-

```
Parent's method2()
_Parent's method1()
```
